

Jerry doesn't like his son Morty going on adventures with Rick. So he is freaking out when he hears "adventure", in fact, he already gets angry at hearing the first 3 letters "adv". Given a text that Jerry hears, can you determine whether he gets angry?

Input

For simplicity, the text is given in the input without spaces. So you are given a single string of lowercase letters of the English alphabet ('a' ... 'z'). The length of the string is at most 100.

Output

Your program should print "yes" or "no" depending on whether the substring "adv" occurs in the input string.

Example

input

```
thedisadvantageofmultipleuniverses
```

output

```
yes
```

Note

Explanation: the input string contains "adv", starting from the 7th character.
